This invention relates to a novel method for altering one or more plant contracteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up or down-regulated in transgenic plants overexpressing the heterodimeric content for the properties and using these sequences to alter plant characteristics accordingly. The present invention describes consymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture contents of plants and animal feed products. Accordingly, these cach relative to the corresponding wild type plants, Accordingly, these cach relative to the corresponding wild type plants, Accordingly, these cach relative to the useful as positive or negative selectable markers curing transformation of cells or tissues. The identified genes play a curing transformation of cells or tissues the identified genes play a coll in a variety of biological processes such as DNA replication, cell coll in a variety of biological processes such as DNA replication, cell cranscription factors. This polymulcleotide sequence is thate cress cDNA repressed 1.3 fold or more in plants overexpressing the EZFA/DPa

This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of Ilowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is the VRNI gene

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynuclectides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynuclectides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                               Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TCAAAGTTCTACGAGAGTGCTTCTGCGAGAAAGAACCGTGACTGCAGAAGAAAAAGAGA 684

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes an Arabidopsis thaliana nucleic acid (I). The polypeptide (II) encoded by (I), transgenic plant (III) or geneticallly modified call (IV) are useful for screening a candidate agent for its biological effect, by combining the candidate agent with (II), (III) or (IV), and determining the effect of the candidate agent on (II), (III) or (IV). (I) is useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of its encoded protein, for mapping functional regions of the protein, in diagnosis, for studying associated physiological pathways, for genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel Arabidopsis thaliana nucleic acid useful for identifying homologous or related genes, and to create genetically modified and transgenic organisms, such as plant cells and plants.
                                                                                                                                                                                                                                                                                                                                                                     Transgenic plant; plant; genetically modified cell; environmental stress; ribozyme creation; disease resistance; stress tolerance; fungicide screening; insecticide screening; gene; ds.

manipulation of certains the entrains that are capable of withstanding a particular disease or environmental stress, for enhancing or inhibiting production of biosynthetic product in a plant, for producing production of biosynthetic product in a plant, for producing polypeptides, as probes for the detection of mRNA in biological samples, to generate additional copies of (1), to generate ribozymes or oligonucleotides, as single stranded DNA probes or as triple-strand transgenic organisms, such as plant cells and plants. (II) or (III) is useful for introducing or improving disease resistance and stress useful for introducing or improving disease resistance, and stress to clerance in plants, screening biological active agents, e.g., fungicides, insecticides, etc., and for elucidating biochemical pathways. (III) is useful as crops for their enhanced diseased resistance, enhanced convironmental stress, or to produce a factor. This sequence represents a nucleic acid that may correspond to naturally corrunting Arabidopsis thaliana expressed sequences. Note: The sequence contains the patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   367
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         848
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      908

                                                                                                                         The invention relates to identifying a stress condition to which a plant representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell with an detecting a profile of expressed polymucleotides in the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell production of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abloric stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                             1784 réadcitricadrierritrice de recentada récida récident de la 1842
                                                                    Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                      96 TGAGCTTTCGGTTGCTGTTGCACTCACAGTACCTGATGGTCATGTTTGGCGTGTAGGACT 155

Price JL, Raines TM, Yu Y; Ledford BL, Woessner JP, Haas WD; Davis KR, Allen K, Hoffman N;

Novel Arabidopsis thaliana nucleic acid useful for identifying homologous or related genes, and to create genetically modified and transgenic organisms, such as plant cells and plants. Claim 1; SEQ ID NO 569; 43pp; English.

```
The invention describes an Arabidopsis thaliana nucleic acid (I). The polypeptide (II) encoded by (I), transgenic plant (III) or genetically conditioned cell (IV) are useful for screening a candidate agent for its biological effect, by combining the candidate agent with (II), (III) or (IV), and determining the expension or related genes, for convocations that modulate the candidate agent on (II), (III) or (IV). (I) is useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of its encoded protein, for mapping innoctional regions of the protein, in diagnosis, for studying associated physiological pathways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of various production of blosynthetic product in a plant, for cor inhibiting production of blosynthetic product in a plant, for cor inhibiting production of blosynthetic product in a plant, for correct additional copies of (I), to generate ribozymes or colligonoucleotides, as probes for the detection of maNA in biological samples, to generate additional copies of (I), to generate ribozymes or colligonoucleotides, as probes for the detection of maNA in biological confined organisms, such as plant cells and plants. (II) or (III) is constined for introducing or improving disease resistance and stress consting behavase. Constined in plants, screening biological active agents, e.g., fungicides, insecticides, etc., and for elucidating biochemical pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       traits of interest, for screening programs, as crops which exhibit enhanced tolerance to environmental stress, or to produce a factor. This sequence represents a nucleic acid that may correspond to naturally occurring Arabidopsis thaliana expressed sequences. Note: The sequence data for this patent did not form part of the printed specification, but sequence obtained in electronic format directly from the US patent office at sequence.uspto.gov/sequence.thml?DocID=999909770423
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 411 BP; 155 A; 92 C; 57 G; 107 T; 0 U; 0 Other;

GENERAL INFORMATION:

APPLICANT:

APPLICANT: Feng, Paul C.C.

APPLICANT: Fincher, Karen L.

APPLICANT: Fincher, Karen L.

TILE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With

TILE OF INVENTION: Plants

FILE REFERENCE: 38-21(52274)B

CURRENT FILING DATE: 2001-12-12

PRIOR APPLICATION NUMBER: US 60/255, 619

PRIOR FILING DATE: 2000-12-14

NUMBER OF SEQ ID NOS: 17880

SEQ ID NO 9015
APPLICANT: Kovalic David K
APPLICANT: Zhou Yihua
APPLICANT: Car Zhou Yihua

Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage : Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage : BP 191 91006 ENRY cedex - PRANCE (B-mail : seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr)

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction : Temple G.

Genoscope members carried out sequencing and annotation : Castelli V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M.

URGV INRA : Clapet C., Caboche M.

Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.
